**General Description**

The HM61 series devices are a set of three terminal low power voltage detectors implemented in CMOS technology. Each voltage detector in the series detects a particular fixed voltage ranging from 0.9V to 5.0V. The voltage detectors consist of a high-precision and low power consumption standard voltage source as well as a comparator,

hysteresis circuit, and an output driver (CMOS inverter or NMOS open drain). CMOS technology ensures low power consumption.

Although designed primarily as fixed voltage detectors, these devices can be used with external components to detect user specified threshold voltages.

## Application Circuits

### Microcomputer Reset Circuit

Normally a reset circuit is required to protect the microcomputer system from malfunctions due to power line interruptions. The following examples show how different output configurations perform a reset function in various systems.

NMOS open drain output application for separate power supply

NMOS open drain output application with R-C delay

### 5V Power Line Monitoring Circuit

Generally, a minimum operating voltage of 4.5V is guaranteed in a 5V power line system. The PTÎFÁs recommended for use as 5V power line monitoring circuit.

### Power-on Reset Circuit

With several external components, the NMOS open drain type of the PTÎFÁseries can be used to perform a power-on reset function as shown:

**Change of Detectable Voltage**

If the required voltage is not found in the standard product selection table, it is possible to change it by using external resistance dividers or diodes. Varying the detectable voltage with a resistance divider

$$\text{Detectable voltage} = \frac{R_A + R_B}{R_B} \times V_{DET}$$

$$\text{Hysteresis width} = \frac{R_A + R_B}{R_B} \times V_{HYS}$$

Varying the detectable voltage with a diode

**Level Selector**

The following diagram illustrates a logic level selector.

$$\text{Detectable Voltage} = V_{f1} + V_{f2} + V_{DET}$$

**Malfunction Analysis**

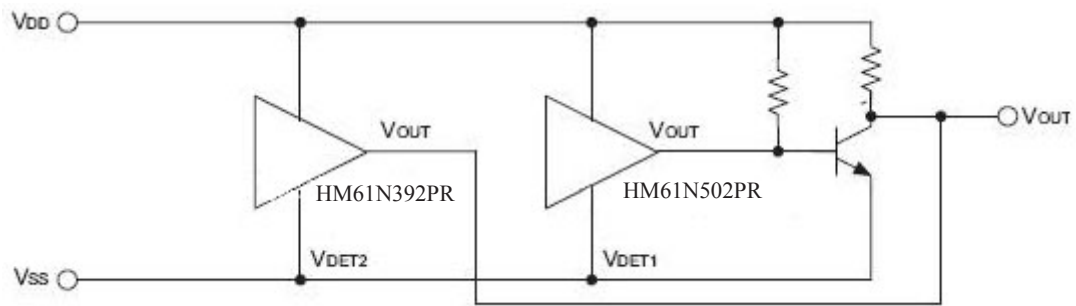

The following circuit demonstrates the way a circuit analyzes malfunctions by monitoring the variation or spike noise of power supply voltage.

**Charge Monitoring Circuit**

The following circuit shows a charged monitor for protection against battery deterioration by overcharging. When the voltage of the battery is higher than the set detectable voltage, the transistor turns onto bypass the charge current, protecting the battery from overcharging.
