

=U ~~CE~~ #~ High Efficiency Low Noise PFM Step-up DC/DC Converter

OUTLINE:

HMXX1C series are CMOS-based PFM step-Up DC-DC Converter. The converter can start up by supply voltage as low as 0.8V, and capable of delivering maximum 200mA output current at 3.3V output with 1.8V input Voltage. Quiescent current drawn from power source is as low as 20uA. All of these features make HMXX1C series be suitable for the portable devices, which are supplied by a single battery to four-cell batteries.

To reduce the noise caused by the switch regulator, HMXX1C is well considered in circuit design and manufacture. So that the interferer to other circuits by the device is reduced greatly.

HMXX1C integrates stable reference circuits and trimming technology, so it can afford high precision and low temperature-drift coefficient of the output voltage.

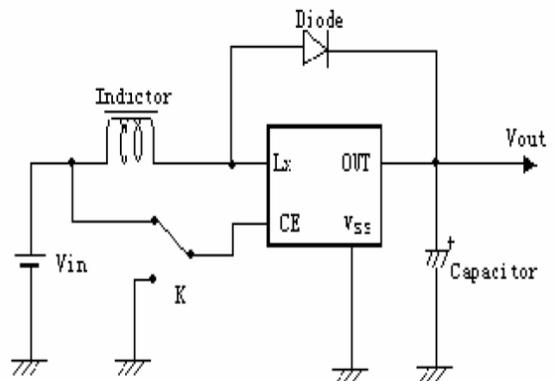

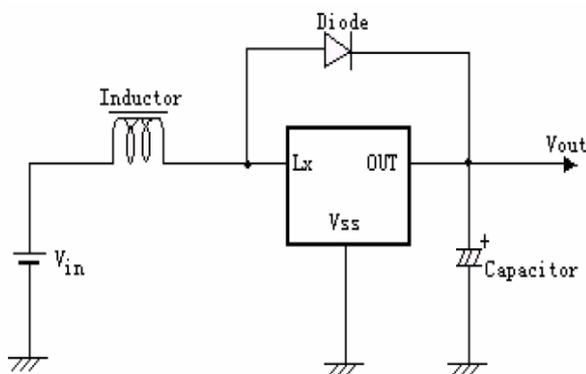

HMXX1C is available in SOT-89-3, SOT-23-3 and SOT-23-5 packages that is PB free. And in 5-pin packages, such as SOT-23-5, the device can be switch on or off easily by CE pin, to minimize the standby supply current.

FEATURES:

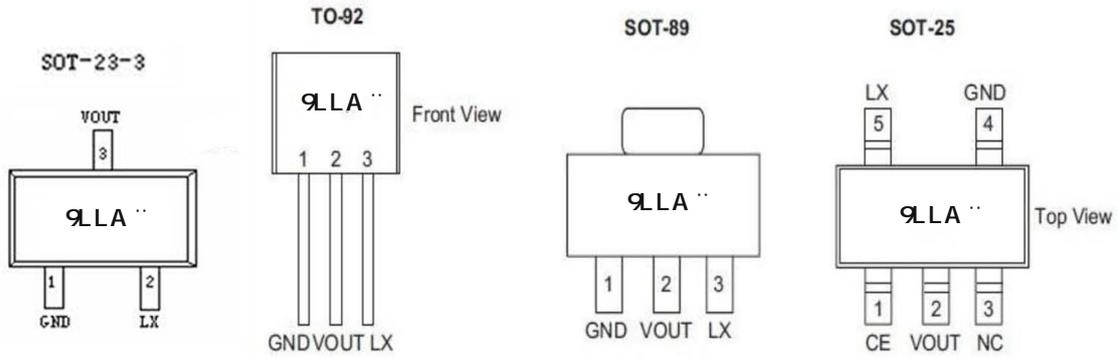

- Deliver 500mA at 5.0V Output voltage with 4.0V input Voltage
- Low start-up voltage (when the output current is 1mA)-----0.8V
- Output voltage can be adjusted from 2.2V to 6.0V (In 0.1V step)
- Output voltage accuracy -----±2 %
- Low temperature-drift coefficient of the output voltage-----±100ppm/°C
- Only three external components are necessary: An inductor, a Schottky diode and an output filter capacitor
- Low quiescent current drawn from power source-----<10uA

APPLICATIONS

- Power Source for PDA, DSC, MP3 Player, Electronic toy and wireless mouse
- Power Source for a Single or Dual-cell Battery-Powered Equipments
- Power Source for LED

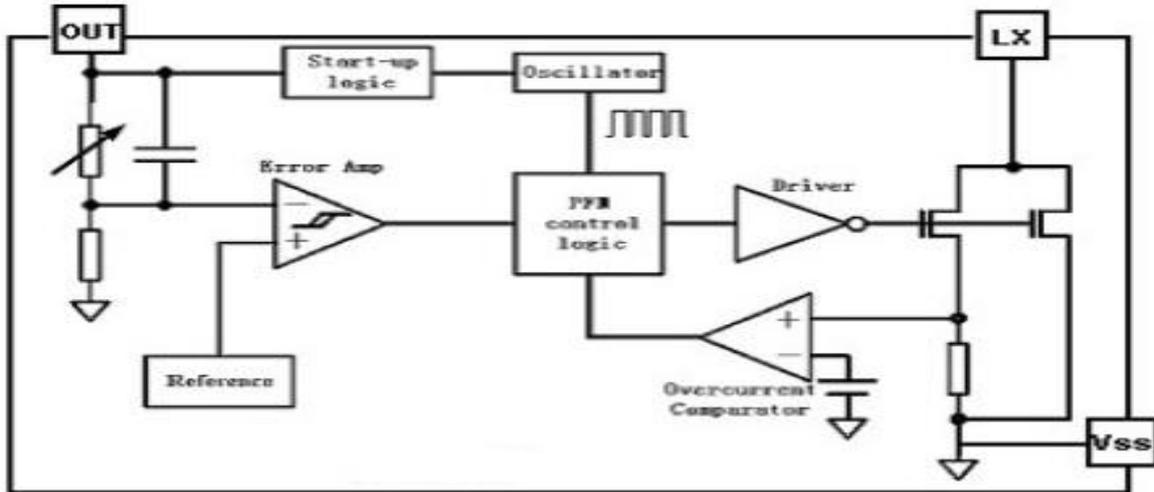

PIN DESCRIPTION:

ABSOLUTE MAXIMUM RATINGS

Input voltage range-----	0.3V~12V
Input voltage: $V_i(LX)$ -----	0.3V~($V_{out}+0.3$)
CE pin voltage-----	0.3V~($V_{out}+0.3$)
Lx pin output current -----	0.7A
Maximum power dissipation, P_d $T=-25^{\circ}C$	
SOT-89-3-----	0.5W
SOT-23-5-----	0.2W
SOT-23-3-----	0.2W
TO 92-----	0.5W
Maximum junction temperature -----	150°C
Operating free-air temperature range -----	-20~+80°C
Storage temperature range -----	-40~125°C
Lead temperature and time -----	260°C,10S

BLOCK DIAGRAM:

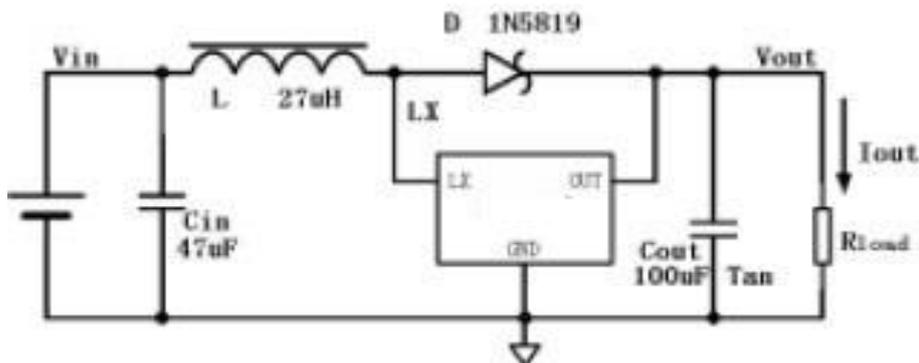

RECOMMENDED OPERATING CONDITIONS

	MIN	NOM	MAX	UNIT
Input voltage range	0.8		V _{out}	V
Inductor	10	27	100	μH
Input capacitor	0	≥10		μF
Output capacitor	47	100	220	μF
Operating junction temperature	-20		85	°C

NOTE:

- 1、 Diode: Schottky type, such as: 1N5817,1N5819,1N5822
- 2、 Inductor: 27uH(R<0.5Ω)
- 3、 Capacitor: 100uF(Tantalum type)

TYPICAL APPLICATIONS:

DETAILED DESCRIPTION

The HMXX1C series are boost structure, voltage-type pulse-frequency modulation(PFM) step-up DC-DC converter. Only three external components are necessary: an inductor, a output filter capacitor and a schottky diode. And the converter's low noise and low ripple output voltage can be adjusted from 2.5V to 5.0V, 0.1V step. By using the depletion technics, the quiescent current drawn from power source is lower than 7uA. The high efficiency device consists of resistors for output voltage detection and trimming, a start-up voltage circuit, an oscillator, a reference circuit, a PFM control circuit, a switch protection circuit and a driver transistor.

The PFM control circuit is the core of the HMXX1C IC. This block controls power switch on duty cycle to stabilize output voltage by calculating results of other blocks which sense input voltage, output voltage, output current and load conditions. In PFM modulation system, the frequency and pulse width is fixed. The duty cycle is adjusted by skipping pulses, so that switch on-time is changed based on the conditions such as input voltage, output current and load. The oscillate block inside HMXX1C provides fixed frequency and pulse width wave.

The reference circuit provides stable reference voltage to output stable output voltage. Because internal trimming technology is used, The chip output change less than $\pm 2\%$. At the same time, the problem of temperature-drift coefficient of output voltage is considered in design, so temperature-drift coefficient of output voltage is less than 100ppm/ $^{\circ}\text{C}$.

High-gain differential error amplifier guarantees stable output voltage at difference input voltage and load. In order to reduce ripple and noise, the error amplifier is designed with high band-with. Though at very low load condition, the quiescent current of chip do effect efficiency certainly.

The four main energy loss of Boost structure DC-DC converter in full load are the ESR of inductor, the voltage of Schottky diode, on resistor of internal N-channel MOSFET and its driver. In order to improve the efficiency, HMXX1C integrates low on-resistor N-channel MOSFET and well design driver circuits. The switch energy loss is limited at very low level.

SELECTION OF THE EXTERNAL COMPONENTS

Thus it can be seen, the inductor and schottky diode affect the conversion efficiency greatly.

The inductor and the capacitor also have great influence on the output voltage ripple of the converter.

So it is necessary to choose a suitable inductor, a capacitor and a right schottky diode, to obtain high efficiency, low ripple and low noise.

(1) Inductor Selection

Above all, we should define the minimum value of the inductor that can ensure the boost DC-DC to operate in the continuous current-mode condition.

$$L_{\min} \geq \frac{D(1-D)^2 R_L}{2f}$$

The above expression is got under conditions of continuous current mode, neglect Schottky diode's

voltage, ESR of both inductor and capacitor. The actual value is greater than it. If inductor's value is less than L_{min} , the efficiency of DC-DC converter will drop greatly, and the DC-DC circuit will not be stable.

Secondly, consider the ripple of the output voltage,

$$\Delta I = \frac{D \cdot V_{in}}{L_f}$$

$$I_{max} = \frac{V_{in}}{(1-D)^2 R_L} + \frac{D V_{in}}{2L_f}$$

If inductor value is too small, the current ripple through it will be great. Then the current through diode and power switch will be great. Because the power switch on chip is not ideal switch, the energy of switch will improve. The efficiency will fall.

Thirdly, in general, smaller inductor values supply more output current while larger values start up with lower input voltage and acquire high efficiency.

An inductor value of 3uH to 1mH works well in most applications. If DC-DC converter delivers large output current (for example: output current is great than 50mA), large inductor value is recommended in order to improve efficiency. If DC-DC must output very large current at low input supply voltage, small inductor value is recommended.

The ESR of inductor will effect efficiency greatly. Suppose ESR value of inductor is r_L , R_{load} is load resistor, then the energy can be calculated by following expression :

$$\Delta \eta \approx \frac{r_L}{R_{load}(1-D)^2}$$

For example: input 1.5V, output is 3.0V, $R_{load}=20\Omega$, $r_L=0.5\Omega$, The energy loss is 10%.

Consider all above, inductor value of 47uH、ESR<0.5Ω is recommended in most applications. Large value is recommended in high efficiency applications and smaller value is recommended

(2) Capacitor Selection

Ignore ESR of capacitor, the ripple of output voltage is:

$$r = \frac{\Delta V_{out}}{V_{out}} = \frac{D}{R_{load} C_f}$$

So large value capacitor is needed to reduce ripple. But too large capacitor value will slow down system reaction and cost will improve. So 100uF capacitor is recommended. Larger capacitor value will be used in large output current system. If output current is small (<10mA), small value is needed. Consider ESR of capacitor, ripple will increase:

$$r' = r + \frac{I_{max} \cdot R_{ESR}}{V_{out}}$$

When current is large, ripple caused by ESR will be main factor. It may be greater than 100Mv. The ESR will affects efficiency and increase energy loss. So low-ESR capacitor (for example: tantalum capacitor) is recommend or connect two or more filter capacitors in parallel.

(3) Diode Selection

Rectifier diode will affects efficiency greatly, Though a common diode (such as 1N4148) will work well for light load, it will reduce about 5%~10% efficiency for heavy load. For optimum performance, a Schottky diode (such as 1N5817、1N5819、1N5822) is recommended.

(4) Input Capacitor

If supply voltage is stable, the DC-DC circuit can output low ripple, low noise and stable voltage without input capacitor. If voltage source is far away from DC-DC circuit, input capacitor value greater than 10uF is recommended.

ELECTRICAL CHARACTERISTICS

SYMBOL	ITEM	TEST CONDITIONS	REFERENCE DATA			UNIT
			MIN	TYP.	MUM	
Vout	Output Voltage		2.45	2.5	2.55	V
			2.646	2.7	2.754	
			2.94	3.0	3.06	
			3.234	3.3	3.366	
			3.528	3.6	3.672	
			3.92	4.0	4.08	
			4.9	5.0	5.1	
			5.88	6.0	6.12	
Vin	Input Voltage			12	V	
Iin	Input Current	Iout=0mA, Vin=Vout*0.6		12	15	uA
Vstart	Start-up voltage	Iout=1mA, Vin: 0→2V		0.8	0.9	V
Vhold	Hold-on voltage	Iout=1mA, Vin: 2→0V	0.6	0.7		V
I _{DD}	Quiescent current drawn from power source	Without external components, =Vout×1.05		4	7	uA
Rswon	Switch ON Resistance			0.4	0.5	Ω
I _{LXleak}	LX leakage current	Vout=Vlx=6V			0.5	uA
VCEH	CE "H" threshold voltage	V _{CE} : 0→2V	0.6	0.9		V
VCEL	CE "H" threshold voltage	V _{CE} : 2→0V		0.3	0.6	V
Fosc	Oscillator frequency	LX on "L" side Vout=Vout*0.96	300	350	400	Khz
Maxdty	Oscillator duty cycle	On (Vlx "L") side	70	75	80	%
η	Efficiency			85		%
